# Project & Task Tracker App

Presentation script · Layout & UI Structure · Group F1-G4

| Presenter | Part |
|---|---|
| Noella | Login, Register, Profile |
| Kabera Samuel | Main layout, bottom bar, side menu, Dashboard, Statistics |
| Ghislaine | Task List, Task Details, Create / Edit Task |

## The big picture (anyone can say this)

- **Layout:** every page is a *Scaffold*, the frame with a top bar and a body. We build each page by putting small pieces inside each other, like rows, columns and cards. Long pages scroll.
- **Data:** there is no server. Everything is saved on the phone in a *SQLite* database. A screen asks a service for data, and the service reads or writes the database.
- **Safety:** forms check the input first. The services check the rules again. If something fails, the user sees a short message and the app does not crash.

## Noella: Login, Register and Profile

> Hello everyone, I am Noella. I built the Login, Register and Profile screens.

> **Login.** The form sits inside a scroll view, so the keyboard never hides the fields. The picture on top is built with a *Stack*: one big circle with two small icons placed on its corners. The Sign In button shows a spinner while it works, so it cannot be pressed twice.

*Demo: tap Sign In with empty fields, then sign in correctly.*

> **Register.** It has the same layout. Every field has a *validator*: the name is required, a role must be chosen, the email must look like an email, the password needs 8 characters, and both passwords must match. If the email is already used, the user sees a clear message. After success, we go back to Login and show "Account created".

*Demo: enter two different passwords, then create an account.*

> **Safety.** If the email or password is wrong, we show one message, "Wrong email or password", so nobody can find out which emails exist. Passwords are never saved as plain text. We save a scrambled version of them.

> **Profile.** It is a list of options inside a card: edit profile, settings, about, sign out and delete account. When the user signs out, we use *Navigator* to clear the page history, so Back cannot return to the app. Delete account asks for confirmation, and it is blocked if the user still has tasks.

*Demo: open Edit profile, then Sign out.*

> That is my part. Now Kabera will show the main layout and the dashboard.

## Kabera Samuel: Layout, Navigation, Dashboard, Statistics

> Hello, I am Kabera. I built the main structure, the navigation, the dashboard and the statistics page.

> **Bottom bar.** After login, the user enters the main screen. It is one Scaffold with a *NavigationBar* at the bottom. The screen remembers one number: the selected tab. When the user taps a tab, *setState* changes that number and the body shows the matching page. The bar stays, only the body changes.

*Demo: tap Home, Tasks, Team, Profile.*

> **Side menu.** The drawer shows the user's name and the same links. "Task statistics" is not a tab, so it opens as a new page on top, which is why it has a back arrow.

*Demo: open the menu, tap Task statistics, then go back.*

> **Dashboard.** The page is a *ListView*, so it scrolls. The green card shows the total tasks and the percentage, which is completed tasks divided by all tasks. Under it are four colored boxes in a grid with two columns. Then comes the donut chart, with the total number placed in the middle, and the latest task updates.

> **Data.** The dashboard loads the tasks from the database when it opens. The status of each task (On Track, At Risk, Overdue, Completed) is calculated from its due date, with one rule used on every screen, so all pages always agree. The statistics page shows the same numbers as a bar chart, plus the upcoming deadlines.

*Demo: scroll the dashboard, tap the Statistics card.*

> While data loads, every screen shows a spinner. If it fails, it shows a Try again button. Now Ghislaine will present the task screens.

## Ghislaine: Task List, Task Details and Create Task

> Hello, I am Ghislaine. I built the three task screens.

> **Task List.** At the top there is a search box and filter buttons. Below them, the tasks are shown as cards in a *ListView*. The list is placed in an *Expanded* widget, so it takes all the remaining space. Each card has the member avatar, the title, the assignee and date, and two small labels for the deadline and the status. If nothing matches, a friendly empty message appears.

*Demo: type in the search, tap a filter, open a task.*

> **Task Details.** This page scrolls because it can be long. It shows the information in a card, a colored box that explains the deadline status, and the notes. Users can add notes, and only the author can edit or delete their own note. Deleting a task or a note always asks for confirmation first.

*Demo: add a note, then tap Edit task.*

> **Create / Edit Task.** One screen is used for both. When editing, the fields are already filled. The *Form* checks that the title, the assignee and the due date are filled. When saved, the task is written to the database and we go back to the list with a message. If saving fails, what the user typed is kept. If the user leaves with unsaved changes, we ask "Discard changes?".

*Demo: save with an empty title, then create a task.*

> That is the task part. Thank you.
